

New York City TLC Project Preliminary Data Summary

EXECUTIVE SUMMARY REPORT

Commission Prepared By Automatidata

OVERVIEW

The New York City TLC has hired Automatidata to develop a regression model that helps estimate taxi fares before the ride, based on data that TLC has gathered. In this part of report, the preliminary inspection done by Automatidata data team over the data given by NYC Taxi and Limousine Commission provides descriptions of key data variables and ensures the information provided is suitable for generating clear and meaningful insights.

PROJECT STATUS

- The dataset was explored to find unusual values.
- Considered which variables are most useful in making a predictive model. (In this case: total_amount, trip_distance)
- Examined other variables which provide relevant insights.
- Build the groundwork for further EDA, visualizations, and model building.

NEXT STEPS

1. Conduct a complete exploratory data analysis.
2. Perform data cleaning and data analysis to understand unusual variables(eg. outliers).
3. Use descriptive statistics to learn more about the data.
4. Create and run regression model.

KEY INSIGHTS

The unusual variables identified were 'trip_distance' and 'trip_duration'. They reflected that long distance rides have less charges associated with them. Reference Screenshot

trip_distance		total_amount	
9280	33.96	8476	1200.29
13861	33.92	20312	450.30
6064	32.72	13861	258.21
10291	31.95	12511	233.74
29	30.83	15474	211.80
18130	30.50	6064	179.06
5792	30.33	16379	157.06
15350	28.23	3582	152.30
10302	28.20	11269	151.82
2592	27.97	9280	150.30
20612	27.88	1928	137.80
1908	27.34	10291	131.80
20545	27.20	6708	126.00
4138	26.86	11608	123.30
15169	26.54	908	121.56
